Cohort — Quick Reference

Commands & skills, ordered for day-to-day use. Slash commands run in your IDE; `cohort …` in the terminal. Generated from canonical.

BUILD & SHIP · DAILY

/plan Break work into small verifiable tasks with acceptance criteria and dependency ordering

/build Implement the next task incrementally — build, test, verify, commit

/test Run TDD workflow — write failing tests, implement, verify. For bugs, use the Prove-It pattern.

/goal Drive a GitHub issue to a draft PR — build, then an independent judge verifies each criterion (max 3 rounds)

/code-review Conduct a five-axis code review — correctness, readability, architecture, security, performance

/code-simplify Simplify code for clarity and maintainability — reduce complexity without changing behavior

/spec Start spec-driven development — write a structured specification before writing code

/ship Run the pre-launch checklist via parallel fan-out to specialist personas, then synthesize a go/no-go decision

MULTI-VENDOR · ORCHESTRATE & REVIEW

/crew Cross-vendor build — a coordinator routes work to the cheapest capable model from any vendor; Claude subagents write, external engines propose gated patches

/scout Multi-vendor adversarial review — fan disjoint areas to Claude tiers, ChatGPT, and Grok, cross-examine over two rounds, synthesize with convergence

/ratchet Metric-gated autonomous optimization loop — propose, evaluate, keep the gain or revert, in a throwaway worktree; you review the staircase and merge

/consult-gpt Get a second opinion from ChatGPT (via the OpenAI Codex CLI, read-only) on a hard problem — advisory, cross-examined, never executed blindly

/consult-grok Get a second opinion from Grok (via xAI's API, direct) on a hard problem — advisory, cross-examined, never executed blindly

SECURITY · ANALYZE ARTIFACTS

/reverse Reverse engineer a shipped artifact — confirm authorization, route the target, analyze static-first, and report observations vs inferences; execution waits for your yes

EXTERNAL ENGINES · COHORT ENGINE …

consult <e> --tier One-shot advisory, read-only. Tier: cheap | flagship | reasoning.

review <e> Read-only agentic explore loop — gated per read, transcript recorded.

propose <e> --agentic Engine proposes a patch; Cohort applies it in a worktree behind the gates. Grok's write path.

work gpt Codex edits natively in its OS sandbox, confined to a throwaway worktree.

ratchet <gpt|grok> The /ratchet loop from the CLI. --evaluator "…" --budget N.

> The line: Claude writes your tree; external engines only ever touch a throwaway worktree — gated proposal (Grok) or OS-sandbox (Codex). You review & merge.

THE OFFICE

ChiefOfStaff Ask first for cross-functional questions — it names the right specialist(s) to consult.

/office-setup Interview the user and tailor the global office — wiring, context, and custom agents.

/project-setup Interview the team about this repo — fill project context and scaffold tailored specialists.

MANAGE COHORT · COHORT …

dashboard Local web UI (mission control) at 127.0.0.1:8787.

/update Update Cohort to the latest upstream version and recompile your IDEs.

recompile --ide X Recompile the office into an IDE (claude/codex/cursor/copilot).

status Read-only view of the install.

my-office sync Sync your personal layer to/from a git remote.

my-office review·approve Review & approve quarantined pulled artifacts.

office review·approve Review & approve office-layer quarantine.

/snapshot Capture a session snapshot for this repo's Cohort context, filled from this conversation.

/feedback Rate an office agent or command from inside the IDE (fuels the improvement loop).

distill Compound recent sessions + feedback into project memory.

SKILLS · AUTO-FIRE WHEN RELEVANT

office-guide How to work with the Cohort agentic office — routing, the daily loop, health checks.

adversarial-review How to run a multi-vendor adversarial review — disjoint areas, model/vendor routing, two-round refutation, convergence synthesis (the /scout method).

karpathy-discipline Four sharp coding rules (Karpathy) — think before coding, simplicity first, surgical changes, goal-driven — as measurable tests, complementing fable-mode's process gates.

reverse-engineer How to reverse engineer a shipped artifact — route the target, work summary-first, separate observation from inference, gate execution. Method adapted from REA (MIT); the REA engine is optional and user-installed.

MORE COMMANDS

/audit Recurring deep adversarial audit of the application and the business that ships it — rotates dimensions and subsystems, keeps a coverage ledger, and sweeps the critical path and go-to-market every run

/barney Explain something Barney style — so simple, so step-by-step, that nobody can get it wrong

/brainstorm Recurring generative sweep for new opportunities and ideas — the creative sibling of /audit. Diverges wide across creative lenses, converges on the strongest, turns survivors into pursuit plans, and keeps an idea ledger so it compounds run over run and never re-generates a dead idea.
